i gave Grok Bot \$75 and told it "earn your keep or get shut off"

48 hours later it's sitting on \$6,140

still running

autonomous trading agent on the platform

I didn't touch a line of code - it lives on its own cloud box with its own browser and terminal, working while I'm asleep

every 20 minutes it:

- > pulls every weather market with a resolution date inside the next 10 days
- > cross-checks the current price against the latest forecast update
- > only opens a position once the forecast and the market disagree by enough to matter
- > sizes up based on how wide that disagreement is
- > places the trade on its own, no approval step
- > covers its own hosting bill straight out of profits

if it ever hits \$0, the subscription gets cut - it's done for good

hour nine it was down to \$14. it dropped every multi-day market it was holding and switched to same-day resolution only

so it changed its own strategy to stay alive

setup took one evening: spin up the bot, run one trade in front of it, put it on a timer, hook up wallet

no VPS. no API keys. no dev on call.

Hello claude. This is a tweet where I got the idea to create something for day trading. This idea uses the weather market but that's not something I'm interested in. I would want to find a market that is more predictable and have a bot make trades for me. My idea is that I let Claude research the market I want and I can deposit money for it to trade on its own. It will never add or request money from me. It will need a withdraw button and deposition and I think I want to create this with Kalshi or Robinhood or another account that can be good to day trade and leave on.
